

Connection method A - 10, 22awg wires required.  
Allows control of LED ring and both fans

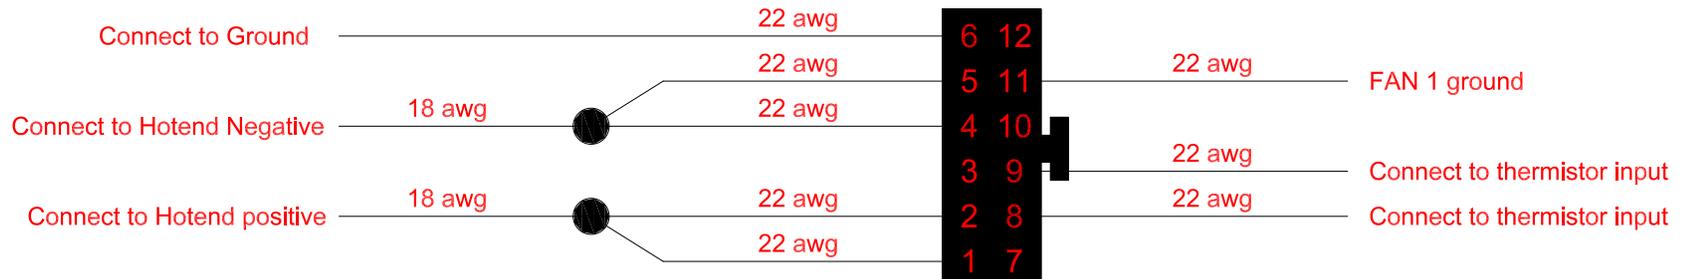

The RAMBo Board uses a common Positive. The Hotend positive also feeds power to the LED and fans. Pins 1,2,3 should be connected to the Hotend Positive. The Hotend Temperature is controlled by the Hotend negative via PID. The Fans and LEDs are also controlled by the ground side so to turn on fans or LEDs simply give the corresponding pin a ground.

Connection method B - 8, 22awg wires required.  
Allows control of LED ring and one fan - OR - 2 fans and no LED

Connection method C - 8, 22awg wires required.  
Allows control of Fan 1 from RAMBo LED ring and fan 2 always ON

Solder a jumper wire from the LED and FAN2 ground side (black) to the AUX solder pad number 6
